                                                                                                                                                         -!- FUNCTION: Transcription factor that binds to the octamer motif ('ATTTGCAT'). Activates cytokeratin 10 (K10) gene expression. May serve a regulatory function with respect to epidermal development. Isoform 2 inhibits transactivation by OCT-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                           -:- SUBCELLULAR LOCATION: Nuclear.

Submitted (JAN-2000) to the EMBL/GenBank/DBBJ databases.
-!- FUNCTION: May function as a transcription factor.
-!- SUBCELLULAR LOCATION: Nuclear (Probable).
-!- SIMILARITY: BELONGS TO THE KRUEPPEL FAMILY OF C2H2-TYPE ZINC-FINGER PROTEINS.

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
Schnerch A., Schein J.E., Jones S.J.M., Marra M.A.;
"Generation and initial analysis of more than 15,000 full-length human and mouse cDNA sequences.";
Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002).
-!- FUNCTION: Possesses 5'->3' exoribonuclease activity and may be involved in homologous recombination and RNA metabolism, such as RNA synthesis and RNA trafficking.
-!- SUBCELIULAR LOCATION: Nuclear (Potential).
                                                                                                                                                                                        IsoId=Q9DBR1-2; Sequence=VSP_007235;
Note=No experimental confirmation available. May result from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GYPREGRKYPLPPPSGRYSWN -> VISTMWAVEGKQHTAH
                                                                                                                                                                                                                                  -I- TISSUE SPECIFICITY: Expressed in the spleen, testis, heart, brain, lung, liver, skeletal muscle, and kidney.
-I- SIMILARITY: Belongs to the 5'-3' exonuclease family.
-I- SIMILARITY: Contains 1 CCHC-type zinc finger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pfam; PF03159; XRN_N; 1.—

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  similarity).
-!- CATALYTIC ACTIVITY: An alkanesufonate (R-CH(2)-SO(3)H) + FMNH(2) +
0(2) = an aldehyde (R-CHO) + FMN + sulfite + H(2)O.
-!- SIMILARITY: Belongs to the ssuD family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "Complete genomic sequence of nitrogen-fixing symbiotic bacterium Bradyrhizobium japonicum USDA110.";

```

Gastrointestinal epithelial tumour cell; alpha6beta4 integrin; tumour-associated antigen; metastatic disease; malignant disease; tumour typing; tumour screening; tumour.

Synthetic. Macaca fascicularis.

```
The present sequence represents a Monkey antibody light chain linked to a heavy chain. The antibody binds to a target structure displayed in and on the cell surface of human gastrointestinal epithelial tumour cells and in a subpopulation of normal human gastrointestinal epithelial cells. The target structure especially comprises alphaébeta4 integrin. This is a tumour-associated antigen. The antibody, and its fragments, are useful for treating conditions based on anti-angiogenic mechanism in humans. They are useful for treating human metastatic and malignant disease, comprising tumour typing, tumour screening, tumour disgnosts and prognosis and monitoring premalignant conditions. Quantitative in vivo tumour deposits is carried out by determining the localization of antibody to tumour deposits in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention comprises a method (ribosome display system) for obtaining a specific binding pair (sbp) member that binds a complementary sbp member of interest. The method involves incubating mRNA molecules encoding an sbp and lacking an in-frame stop codon, allowing ribosome translation of the mRNA to produce the encoded sbp member, forming complexes comprising ribosome, mRNA, and encoded sbp member displayed on the ribosome. The ribosome display system is useful for the selection of an sbp member able to bind a complementary sbp member. The present amino acid sequence represents a GPI-linked cell surface receptor-specific VL
                                                                                                    Ribosome display system; specific binding pair; sbp; anti-FITC; VL CDR3; scFv antibody generation; GFI-linked cell surface receptor.
                                                                                                                                                                                                                                                                                                                                                                                          Obtaining specific binding pair member (I) that binds a complementary specific binding pair member of encapsidating specific binding pair member/ribosome complexes in a viral coat, comprises the use of a

The present invention describes a method (M1) for amplifying a nucleic acid strand. M1 comprises providing an engineered nucleic acid strand (S) acid strand. M1 comprises providing an engineered nucleic acid strand (S) having a predetermined sequence at the other, and contacting (S) with a primer having the predetermined sequence in the presence of a polymers concletions under conditions suitable for polymerisation of the and nucleotides. Also described is an engineered nucleic acid strand (I) having a predetermined sequence at one end and a sequence complementary to the predetermined sequence at one end and a sequence complementary to the predetermined sequence at the other end. M1 is useful for amplifying a nucleic acid. M1 can be used for producing an antibody library, M1 is useful for preparing amplified products that can be used to transform an appropriate host organism to produce the polypeptide or protein encoded by the target sequence. M1 is useful to amplify a simultaneously of related sequences to build a complex library such as, for example an antibody library. M1 is useful not only for producing large amounts of antibody library. M1 is useful not only for producing large amounts of the farget nucleic acid sequence, but also for amplifying simultaneously core than one different target nucleic acid sequence located on the same or different mucleic acid molecules. Acc62635 to Acc62753 and ABR54811 to accept the present sequence used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BLys; B lymphocyte stimulator; TNF superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulator; immunosuppressive; immunostimulator; immunostimulator; antirheumatic; antiAIDS; vaccine; cancer; immune; autoimmune disorder; immunodeficiency; systemic lupus erythematosus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TRP) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunombulatory, antithemmatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat disease associated with aberrant BLyS expression activity such as cancer, immune, and autoinfmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthitis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and cquired immunodeficiency syndrome (AIDS)). This invention describes novel antibodies that immunospecifically bind to a Lymphocyte Stimulator (BLyS) polypeptides. BlyS is a member of the tumour necrosis factor (TNF) such family and induces B cell proliferation and differentiation. The antibodies of the invention have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (GLyD) and antipodeficiency common variable immunodeficiency (CVID) and activity immunodeficiency (CVID) and activity immunodeficiency (CVID) and activity and autoimmunodeficiency (CVID) and activity and antipodeficiency (CVID) and activity and ammunodeficiency (CVID) and and ammunodeficiency (CVID) and common variable immunodeficiency (CVI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

New human protein able to suppress growth of cancer cells and its encoding polynucleotide. Claim 1; Page 39 (Disclosure); 65pp; Chinese.

The present invention describes human proteins with cancer suppressing activity. Also described are the polynucleotides encoding the proteins and a process for preparing the proteins by DNA recombination. The proteins and polynucleotides can be used in the treatment of diseases Gaps ö such as cancer. The present sequence represents a human cancer suppressing protein from the present invention Score 43; DB 5; Length 508; Pred. Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders. WPI; 2002-114799/15.

Hilbert

Claim 1; Page 2763-2764; 3148pp; English

This invention describes novel antibodies that immunospecifically bind to

tumour necrosis factor (TNF) super family and induces B cell
cylostation and differentiation. The antibodies of the invention have
cytostatic, immunosuppressive, immunostimulant, immunomodulatory,
antitheumatic and antiAlDS activity and can be used in vaccines to
inhibit the expression and activity of BLyS. The antibodies bind to BLyS
cand so may be used to detect and quantitate the presence of BLyS in
biological samples and may be used in this way to diagnose disease
associated with aberrant expression of BLyS. They may also be
associated to treat diseases associated with aberrant BLyS expression
and activity such as cancer, immune, and autoimmune disorders and
diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis,
immunodeficiency (e.g. common variable immunodeficiency (CVID) and
acquired immunodeficiency syndrome (AIDS)). ABP43399-ABP47228 represent
the antibodies and fragments of the antibodies described in the method of ö BLyS B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the the invention \$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

Preparing immunoglobulin binding protein array in plant cells by transforming the cells with different polynucleotides encoding binding protein polypeptides specific to ligand, selecting plant cells for preparing array

Disclosure; Page 14; 129pp; English.

The invention relates to transforming a population of cells (e.g. plant cells), comprising using a library of two different polynucleotides encoding different immunoglobulin binding protein (IGBP) polypeptides that specifically bind to a ligand or, form one or more disulphide bonds with polypeptides in transfected cells, to generate an IGBP that binds to a ligand, and transformed plant cells are selected, and preparing an IGBP array in plant cells. At least one peptide sequence has at least 75%

containing the novel polymuclectide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by culturing the genetically engineered host cell under conditions suitable to produce the polypeptide from the culture. (1) can be used in gene therapy. The polymuclectides, polypeptides, antibodies and compositions of the present invention can be used for treating and diagnosing diseases, drug the polymuclectides are useful for expressing and detecting allical trials. The polymuclectides are useful for expressing and detecting Alloiococcus ottifidis. The present sequence represents an Alloiococcus ottifidis antigen protein from the present invention.

sequence identity to a framework region (FR) of a native IgM, IgG, IgA, IgD, IgE, IgY, kappa or lambda immunoglobulin molecule. The method is useful for preparing an immunoglobulin binding protein array, preferably heavy chain binding protein (GIBP) array in eukaryotic cells especially plant cells (e.g. Agrobacterium tumefaciens or maize) or other eukaryotic cells (e.g. insect cells or mammalian cells). The GIBP is useful for discovery of e.g. screening assays of IgBPs having desired characteristics. The present sequence is a mammalian immunoglobulin derived peptide that may be incorporated into an IgBP of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Alloiococcus otitidis; antigenic protein; immunogenic; immunisation; gene therapy; Gram-positive bacterium; infection.

It is encoded by a gene (AAT60384) isolated from a peripheral blood lymphocyte library. The antigen-binding domains of human antibodies (see AAW15522-40) to TGF beta-1 and/or beta-2 can be used to counter the

The present invention describes an isolated polynucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. Alloiococcus otitidis is a Gram-positive bacterium. Also described: (1) an isolated polypeptide that is encoded by the polynucleotide (I); (2) an expression vector comprising the novel isolated polynucleotide (I), its complement, despendant or fragment; (3) a genetically engineered host cell, transfected, transformed or infected with the vector of (2); (4) an antibody specific for the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide, its complement, biological equivalent or fragment, or the polynucleotide that is comprised in the expression vector; (6) a pharmaceulical composition comprising the polypeptide of (1) and a carrier; (7) a protein chip comprising an array of the polypeptides of (1), their biological equivalent or fragment; (8) immunishing against Alloiococcus otitidis by administering to a host the immunogenic composition; (9) detecting and/or identifying Alloiococcus

The chimaeric anti-RhD antibodies can be used for diagnosis and therapy,

```

The DNA sequence of eleven monoclonal antibodies are represented in 0119145-7. Synthetic genes, for both heavy and light chains may be created by combining selected CDR 1, 2, and 3 regions, which may be selected from different antibody mols. having varied binding specificity.

```
The invention relates to regulating a gammadelta T-cell mediated immune response in a mammal and involves administering to the mammal a soluble gammadelta T cell receptor (TCR). The method is useful for treating patients having, or are at risk of developing an intestinal condition, e.g. Crohn's disease, ischaemic colitis, irritable bowel disease, and color such associated with inflammation such as a metastatic lung tumour; a skin condition associated with inflammation or metastatic lung tumour; a skin condition associated with inflammation or such as skin lesion caused by bacterial infection, viral infection or laceration, and a skin cancer; or a condition associated with inflammation of the reproductive tract such as infection caused by bacterial or viral infection that involve the epithelial mucosal lining, a tubal infection, preventing tubal factor infertility, and a cancer selected from ovarian, cervical, uterine, prostate or testicular cancers. Sequences ABRR92485-489 represent murine TCR Vgamma chains used in the
                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   T cell receptor; TCR; gastrointestinal; antiinflammatory; cytostatic; tuberculostatic; dermatological; antibacterial; virucide; gynaecological; cell therapy; Vgamma; mouse.
                 and are capable of providing blood- typing reagents of high specificity and reliability. They can also be used in passive immunisation to prevent haemolytic disease of the newborn. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                       Gapa

```
The invention relates to regulating a gammadelta T-cell mediated immune response in a mammal and involves administering to the mammal a soluble gammadelta T cell receptor (TCR). The method is useful for treating patients having, or are at risk of developing an intestinal condition, e.g. Crohn's disease, ischaemic colitis, irritable bowel disease, and colon cancer; a lung condition associated with inflammation such as airway hyperresposiveness, pneumonia, tuberculosis, and a primary or metastatic lung tumour; a skin condition associated with inflammation or such as skin lesion cancer; or a condition, viral infection or laceration, and a skin cancer; or a condition associated with inflammation of the reproductive tract such as infection caused by bacterial infection caused by bacterial infection, viral infection caused by bacterial infection, preventing tubal factor infertility, and a cancer selected from ovarian, cervical, uterine, prostate or testicular cancers. Sequences ABRE2485-489 represent murine TCR Vgamma chains used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel antibodies that immunospecifically bind to be Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TMF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in associated with aberrant expression of BLyS. They may also be associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAlDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthitis, immune, and autoimmune disorders and immune disorders and immune of the statematoid antibitis, immune and activity such as cancer, immune, and autoimmune disorders and immune disorders and immune of the statematory of the statemator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BLys; B lymphocyte stimulator; TNF superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulat; immunomodulatory; antirheumatic; antiAIDS; vaccine; camer; immune; autoimmune disorder; immunodeficiency; systemic lupus erythematosus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hilbert D;

The present invention describes a polynuciecture (1) comprising a sequence of a Bifidobacterium genome selected from the nucleotida sequence given in ABQ81842 and ABQ81843, or a sequence exhibiting at least 90% identity or which hybridises with the sequence exhibiting at ABQ81842 and ABQ81843. Also described is a polynucleotide (II) encoding a fusion protein, comprising a sequence selected from 1097 sequences given in ABP6528 to ABP66534 ligated in frame to a polynucleotide encoding a certivities, and can be used as an inhibitor of Salmonella. (I) (which is netrologous polypeptide. (I) has an inhibitor of Salmonella. (I) (which is a probe) is useful for the detection and/or identification of activities, and can be used as an inhibitor of Salmonella. (I) (which is a probe) is useful for the detection and/or identification of factorium and/or treating diarrhoea brought about by pathogenic contectic and/or roteavirus. The carrier is a food composition selected from milk, yogurk, curd, cheese, fermented milks, milk based fermented from milk, yogurk, curd, cheese, fermented milks, milk based fermented creal based products, infant formula, pet food or a pharmaceutical composition selected from tablets, liquid bacterial suspensions, dried oral cupplement, wet oral supplement, dry tube feeding or wet tube feeding. (I) is useful in DNA arrays or chips to carry out analysis of the expression of the Bifidobacterium related nucleotide sequences given in the Sequence Listing from the present invention but not mentioned further within the specification but is based on sequence information cup pathon of the bringean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotide comprising Bifidobacterium genome sequence useful as a probe or primer for detecting and/or identifying Bifidobacterium longum
                                                                                                                                                                  Bifidobacterium longum NCC2705; Bifidobacterium; bacterial; antidiarrheic; antibacterial; inhibitor of Salmonella; detection; identification; lactic acid bacterium; diarrhoea; pathogenic bacteria; rotavirus; food composition; pharmaceutical composition.
                                                                                                                              Bifidobacterium longum NCC2705 ORF amino acid sequence SEQ ID NO:114.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a polynucleotide (I) comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

reaction (PCR) primers, oligomers, and for chromosome and gene mapping, reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal carity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in polypeptide and polymucleotide sequences have applications in cappositics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of data and products dependent on DNA and canno acid sequences of the invention. Note: The sequence data for this printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated polynucleotide (I) and polypeptide (II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to novel isolated human secreted polypeptides (I)

and polynucleotides (II). (I) and (II) are useful for treating

inflammatory conditions such as arthritis, nephritis, Crohn's disease,
inflammatory conditions such as arthritis, nephritis, Crohn's disease,
included in increasing haematopoises, stem cell survival, bone growth

condending. (I). (II) and modulators of (II) are useful for

prophylaxis or treatment of one or more cancers. (II) is also useful for

creating transgentc animals useful for studying the in vivo activities of

the polypeptide as well as for studying modulators of the polypeptides.

Creating transgent animals useful for the treatment of central and

brain tissue and is useful for the treatment of central and

brain tissue and is useful for the treatment of central and

peripheral nervous system diseases and neuropathics, such as Alzheimer's,

and brain tissue and is useful for the treatment of central and

peripheral nervous system diseases and neuropathics, such as Alzheimer's,

colerosis. In addition, (I) is involved in chemotactic or chemokinetic

activity, regulation of haematopoiesis and is useful for treating myeloid

cor lymphoid cell disorders, platelet disorders such as thromborytopenia

and for regeneration of bone, cartilage, tendon, ligament and/or nerve

tissue growth, and in tissue repair, healing of burns, incisions, ulcers,

cor periodontal disease. Furthermore, (I) is also useful for gut

protection or regeneration and treatment of lung or liver fibrosis,

creperfusion injury in various tissues, various immune deficiencies and

disorders including severe combined immunodeficiency (SIID), bacterial or

thougal infections, autoimmune disorders eng multiple sclerosis,

theumatoid arthritis, diabetes mellitus, myasthenia gravis, allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Zhou P;

reactions and conditions, such as asthma or other respiratory problems. In addition, (1) affects biorhythms or circadian cycles of rhythms, fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in a vaccine composition to raise an immune response. AAU28020-AAU38395 represent novel human secreted protein amino acid sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polypeptide (I) related to dendritic cells of the immune system and the polynucleotide (II) encoding (I). (I) is useful for screening for candidate therapeutic agents. (II) is useful for studying the presence, amount, distribution and normalcy of certain gene products produced by or expressed on dendritic cells. (II) is also useful to facilitate the discovery of compositions and methods useful for diagnosing and treating certain disease screes. (I) and (II) are useful for diagnostic and therapeutic purposes. (I) is useful in binding studies, for construction and expression of modified molecules, for structure/function studies and for the preparation of polyclonal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polypeptides and polynucleotides related to dendritic cells of the immune system, useful in the treatment of conditions associated with

monoclonal antibodies. (1) is also useful as immunogenic components (e.g. antigens) for preparing antibodies or as targets for binding agent studies. (I) is useful in the treatment of conditions associated with abnormal physiclosy or development, e.g. disease or disorder associated with abnormal expression or abnormal signaling by a dendritic cell. (I) as also useful in the regulation and development of hasmatopoietic cells. The binding agent is useful to isolate and purify the immunogenic components by immunoaffinity chromatography, and as probes to distinguish expression libraries for particular expression products. (II) is useful as templates for the recombinant production of peptides and polypeptides, as probes and primers for the detection of the human genes, for chromosome mapping and as probes or to design PCR primers to identify chomologous genes in other mammalian species. The present sequence chromosome as probes or to design PCR primers to identify chomologous genes in other mammalian species. The present sequence

```

The present sequence is an isolated human isomerase (ISOM) polypeptide. It is useful for treating a disease or condition associated with decreased or increased expression of functional human isomerase. It is useful for treating immune disorders such as inflammation, acquired immunodeficiency syndrome (AIDS), Addison's disease, adult respiratory distress syndrome (AIDS), allergies, anemaia, atherosclerosis, Crohn's disease, atopic dermatitis, glomerulonephitis, Grave's disease, Hashimoto's thyroiditis, multiple sclerosis, osteoporosis, rheumatoid authinimume diseases, diabetes mellitus, cancers and cell proliferative disorders such as actinic keratosis, prostatitis, cirrhosis, and

myelofibrosis

```
This invention relates to novel polypeptides associated with Molecules for Disease Detection and Treatment (MDDT) and the cDNA sequences which encode them. MDDT-antagonists, MDDT-agonists or gene therapy may produce cardiant, cytostatic and neuroprotective activities. The polypeptides and Composition for the diagnosis or treatment of a disease which is associated with decreased expression or over-expression of functional MDDT proteins, for example cardiovascular, neurological, cell proliferative, autoimmune/inflammatory or developmental disorders. They may also be useful in the treatment and diagnosis of cancer, diseases treated with steroids and disorders caused by the metabolic response to treatment with steroids. The present sequence is the amino acid sequence of a human Molecule for Disease Detection and Treatment (MDDT) of the
                             New Molecules for Disease Detection and Treatment polypeptides, useful for preparing a composition for diagnosing or treating e.g. cardiovascular or neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, ISOM, isomerase, antiasthmatic; antiallergic; dermatological; antidiabetic; immunosuppressive; cytostatic; antinflammatory; osteopathic; antipsoriatic; antirheumatic; antiarthritic; anti-HIV; antiarteriosclerotic; antithyroid; nephrotropic; neuroprotective; hepatotropic; gene therapy; immune disorder; autoimmune disease; diabetes mellitus; cancer; cell proliferative disorder.

Intrammentary countitions buth as attrittis, impurates, total autherate, inchaemia-reportusion injury, shock, sepais, immune responses, and is involved in increasing haematopoiesis, stem cell survival, bone growth and remodeling (1), (11) and modulators of (11) are useful for prophylaxis or treatment of one or more cancers. (11) is also useful for creating transgenic animals useful for studying the in vivo activities of the polypeptides. (1) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and cervises the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and cervises. Parkinson's disease, Huntington's disease, and amyotrophic lateral scrivity, regulation of haematopoiesis and is useful for treating myeloid or lymphoid cell disorders, platelet disorders such as thrombocytopenia and for regeneration of home, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, ulcers, or periodontal disease. Furthermore, (1) is also useful for gut transferion or regeneration and treatment of lung or liver fibrosis, protection or regeneration elegeneration or regeneration or injury in action or regeneration or injury in action or regeneration or injury is useful for gut reperfusion of largementaries, and transment of the profession injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis, rheumatoid arthritis, diabetes mellitus, mysthenia gravis, allergic reactions and conditions, such as asthma or other respiratory problems. In addition, (I) affects biorhythms or circadian cycles of rhythms, fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitemins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in a vaccine composition to raise an immune response. AAU28020-AAU28395 represent novel human secreted protein The invention relates to novel isolated human secreted polypeptides (I) and polynucleotides (II). (I) and (II) are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, amino acid sequences of the invention

```
The invention relates to a purified polypeptide with alpha-amylase activity and the polymucleotide encoding it. The polypeptide is useful activity and the polymucleotide encoding it. The polypeptide is useful for hydrolysing starch linkages, for catalysing the breakdown of a starch, for modifying small molecules, for liquefying starch, for washing an object, for textile desizing, for treating lignocellulosic fibers, compute for properties, for enzymatic de-inking of recycled paper improving fibre properties, for enzymatic de-inking of recycled paper or pulp, for producting a high-maltose or high-glucose syrup or a mixed syrup, and for increasing the flow of production fluids from a mixed subterranean formation by removing a viscous, starch-containing, damaging completeranean formation which surrounds a completed well bore. The subterranean formation which surrounds a completed well bore. The polypeptide is also useful for preparing a dough or a baked product prepared from the dough and in corn-wet milling processes, detergents, baking processes, beverages, oil fields (fuel ethanol), brewing processes and starch modification in the paper and pulp industry, for removing carach containing stains from a material and for reducing stains of
                                                                                                                                                                                                                  Novel purified polypeptide with alpha-amylase activity, useful e.g. fo
liquefying starch, for textile desizing, for treating lignocellulosic
fibers, and for producing high-maltose or high-glucose syrup.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          starch containing stains from a material and for reducing staining of bakery products. The invention relates to 1 of 232 isolated or recombinant polynucleotides encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polynucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered benchype as compared to a wild-type or reference plant, or the plant exhibits an altered or plant compared to a wild-type or reference plant, or the plant compared to a wild-type or reference plant, or the plant compared to a wild-type or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polymucleotides, a computer readable medium having stored sequence information, and identifying a homologue sequence from a database comprising a plurality of known plant sequences comprising sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or recombinant polymucleotide is used for producing a plant having a modified trait, the method comprising selecting a polymucleotide to antisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress the polympeptide or antisense nucleic acid, thereby producing a modified plant, and selecting for a modified trait (e.g. increased production of agriculturally useful proteins or metabolic chemicals, pest tolerance, environmental stress response (e.g. drought), microbial disease response response (e.g. drought), microbial disease response and many other traits listed in the specification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

to the nuclectide sequence. The promoter is constitutive or inducible or contractive. The method for altering a trait associated with roots comprises transforming a plant with the recombinant polynucleotide.

Selecting the transformed plants and identifying a transformed plant with the recombinant polynucleotide and selecting the ransformed plant omprises transformed plant with the recombinant polynucleotide and selecting the transformed plant. The method for altering a plant with the recombinant polynucleotide and selecting the transformed plant. The method for altering a plant with the recombinant polynucleotide and selecting the transformed plant. The method for altering a plant, store comprises providing a database sequence comparing the database sequence with the providing a database sequence comparing the database sequence with the polynucleotide, selected sequence with the polynucleotide, selected sequence criteria and transforming the selected database sequence in the plant. The methods are polynucleotide, hybridising the test polynucleotide, hybridising the test polynucleotide in the plant of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               recombinant polymucleotide (a transcription factor) comprising a sequence encoding a polypeptide with at least 6 consecutive amino acids of one of the amino acid sequences given in the specification. The recombinant polymucleotide alters a trait of the transgenic plant 8 roots when compared to the same trait of the roots of another plant lacking the recombinant polymucleotide. Also claimed are methods for altering the expression levels of at least one gene of a plant, altering a trait associated with a plant's roots and altering a trait. The recombinant polymucleotide further comprises a promoter operably linked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of the plant. The transgenic plant is useful for altering a plant's for increasing plant stability. The sequence presented is a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ransforming the hybridising test polymucleotide in a plant to alter rait of the plant. The transgenic plant is useful for altering a mla
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention discloses a transgenic plant having an A. thaliana
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1; SEQ ID NO 128; 159pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of the invention

| Sequence 24066, Application US/09252991A
| Patent No. 6551795
| GENERAL INFORMATION:
| TILE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
| TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
| TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
| TITLE OF INVENTION: AUGUST 05/09/252,991A
| CURRENT APPLICATION NUMBER: US/09/252,991A
| PRIOR APPLICATION NUMBER: US 60/074,788
| PRIOR APPLICATION NUMBER: US 60/094,190
| PRIOR APPLICATION NUMBER: US 60/094,190
| PRIOR PILING DATE: 1998-02-18
| NUMBER OF SEQ ID NOS: 33142
| LENGTH: 448

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US-09-562-737-97

Sequence 97, Application US/09562737

Patent No. 642897

GENERAL INFORMATION:

APPLICANT: Herz, Joachim

APPLICANT: Gotthardt, Michael

TILE OF INVENTION: LDL Receptor Signaling Pathways

FILE REFERENCE: UTSW0708

CURRENT APPLICATION NUMBER: US/09/562,737

CURRENT FILING PATE: 2000-05-01

NUMBER OF SEQ ID NOS: 132

SOFTWARE: PatentIn Ver. 2.1
